NT C4BP controls the classical pathway of complement activation. It
binds as a cofactor to C3b/C4b inactivator (C3bINA), which then
hydrolyzes the complement fragment C4b. It also accelerates the
degradation of the C4bC2a complex (C3 convertase) by dissociating
the complement fragment C2a.

NT C4BP occurs in plasma in two forms, both of which bind complement
fragment C4b. The prevalent higher molecular weight form contains
7 alpha chains and one beta chain, which are linked by disulfide
bonds. The beta chain binds the vitamin K-dependent plasma
protein S. A minor form lacks the beta chain. Bound protein S is
inactive as a cofactor for protein C inactivation of coagulation
factors V and VIII.
